

Alexey Yurchenko

CTO / Founding Engineer — Go, Platform, AI Agents

alexes.dev@gmail.com · github.com/alexesdev

Based in Vietnam · Working time zone: UTC+6

Remote · Full-time or contract · A role accountable for architecture and outcomes, not lines of code

PROFILE

15 years in software, four of them as a CTO. I returned to FRESH as CTO to lead its merger with two acquired companies; my team of 10 cost \$8k a month and did the work the acquired company's team had done for \$20k. Now I am building Fleetbox, a self-hosted platform for fleets of AI agents: I own the architecture and acceptance, and a team of AI coding agents implements it. My strength is not writing code: assembling a product from proven open-source parts, keeping the core small, and verifying it into production.

TECHNICAL SKILLS

Leadership: CTO, technical integration in a merger, business analysis, hiring and mentoring, directing AI coding agents.

Backend & data: Go, Python, TypeScript, Ruby; REST, GraphQL, gRPC; PostgreSQL, SQLite, ClickHouse, BigQuery, Redis.

Infrastructure: Nomad / Consul / Vault, Ansible, Docker, Kubernetes, gVisor, Traefik, OIDC, Google Cloud, S3, Prometheus / Loki / Grafana.

Frontend: React, React Native, \$mol.

EXPERIENCE

Founder & CTO — Fleetbox

Jul 2026 – Present · Remote

Building Fleetbox, a self-hosted platform where a business runs a fleet of LLM agents, each in its own isolated pod with Telegram, a knowledge base, a browser, and integrations. Second build: the first, three months of vibe coding, fell apart; I rebuilt it core-first in cycles of one week building, two weeks testing.

- The core is the open-source Hermes agent, caged in an isolated pod: the platform is a harness over its harness, not an agent of my own.
- Designed the whole platform: a Go / GraphQL control panel, Nomad / Consul orchestration, secrets in Vault via Workload Identity, Ansible, gVisor isolation, backups with tested restores, Prometheus / Loki / Grafana.
- The code is written entirely by AI coding agents; I review the critical paths by hand. Engineering rules are checkable invariants, architecture decisions stay with me, acceptance is independent verification and five gates before production. 600+ pull requests in two months; running in production and at customer (BYOC) sites.
- Set the security model of two independent walls on every path to a secret: the panel writes secrets to Vault but cannot read any, and refuses to start if Vault would let it.

Go · GraphQL · Nomad · Consul · Vault · Ansible · gVisor · Traefik · OIDC · Prometheus · LLM agents

Independent Engineer — trip2g

2025 – Present · Remote

trip2g is an open-source knowledge platform (MIT) with external users; in Fleetbox it is agent memory. The last project where I wrote the code by hand. The lesson: an engineering instinct left unchecked builds a Swiss army knife — trip2g grew into a markdown framework that only an agent can use to the full. That is why Fleetbox was built core-first.

- Go backend for markdown publishing, knowledge graphs, and retrieval over MCP and across federated bases; agent workflows for content, video, and landing pages.

Go · TypeScript · SQLite · Litestream · S3 · MCP · RAG

EARLIER EXPERIENCE

Data / Backend Engineer, Tool Team — P2P.org

Aug 2022 – Jan 2024 · Remote

Built data infrastructure for Proof-of-Stake blockchain networks.

- Developed Python and Go extractors for Cosmos SDK networks; processed terabytes of on-chain data into BigQuery for analysts.
- Owned the pipelines from extraction through transformation to delivery. Built gRPC / Protobuf APIs for the results and worked with other teams on data schemas and service requirements.
- Built an open-source Agoric state viewer in React / TypeScript while owning the Agoric integration; the Agoric team adopted the tool for daily use.
- Deployed services on Google Cloud and Kubernetes using Docker.

Python · Go · BigQuery · gRPC · Protobuf · Google Cloud · Kubernetes · Cosmos SDK

CTO — FRESH (myfresh.ru)

Jul 2018 – Apr 2022 · Moscow

Returned to the company as CTO to lead its merger with the acquired moscowfresh.ru and familyfriend.com. Grocery delivery with 300 employees, two warehouses, and approximately 1,000 orders per day.

- Key result: my team of 10 cost \$8k a month and did the work the acquired company's team had done for \$20k.
- Consolidated the applications, data, and operational workflows of three companies into one system.
- Also acted as the business analyst: processes were captured directly in code rather than in written procedures. The warehouse system — inventory, supplies, shipments, industrial scales and cash registers — became the description of how the company worked.
- Led a cross-functional team across backend, frontend, mobile, design, and product; hiring, mentoring, and technical direction.
- Go / GraphQL services, React storefronts, React Native apps, and Metabase for department reporting; 30+ VMs on Nomad / Consul with GitLab CI/CD and Prometheus / Grafana monitoring.

Go · GraphQL / gqlgen · PostgreSQL · React · React Native · Nomad · Ansible · Metabase

Full-stack Engineer — Statsbot

Dec 2017 – Apr 2018 · Moscow

- Developed features for an early-stage analytics SaaS using Ruby on Rails and React, working on business intelligence and analytical workflows.

Full-stack Engineer — FRESH (myfresh.ru)

Jan 2014 – Dec 2017 · Moscow

- Joined as the sole engineer; maintained and extended the Rails / React commerce platform and mobile web experience.
- Fixed a performance issue in Arbre (ActiveAdmin's rendering library), speeding up the affected rendering path by approximately 8x; the fix was merged upstream.
- Maintained the Objective-C iOS application and migrated it to React Native.

Freelance Web Developer

2011 – 2014

- Delivered websites and web applications for small businesses using PHP / Yii, Ruby on Rails, JavaScript, and relational databases.

LANGUAGES & OPEN SOURCE

English — B2+ · Russian and Ukrainian — native.
